*Recipe for preventing the Fly in Turnips.*

Take the quantity of two-penny worth of horse aloes, and the same quantity of flour of brimstone; dissolve these well in about three or four quarts of water. Before the Turnip seed is sown, throw it into the prepared water, for about an hour, but no longer. This quantity of prepared water will steep five or six pounds of seed. If a large quantity of seed is required to be sown, increase the ingredients in the above proportion. There is no occasion to use the preparation in a wet season, as it is only in very dry season that the Fly appears.
